As microgrids become increasingly integral to the global energy landscape, addressing challenges such as system stability, integration with renewable energy sources,

Microgrids (MGs) have the potential to be self-sufficient, deregulated, and ecologically sustainable with the right management. Additionally, they reduce the load on the utility grid.

It is against this backdrop that this paper focuses on the simulation and analysis approaches for sustainable planning, design, and development of microgrids based on clean energy

Sophisticated and advanced control systems used in microgrids raised the need for detailed simulation and studies in RT before implementing in the field. This paper attempted to

To deal with this change, one needs to interpret the electrical grid as a system of systems (SoS) and build new models that capture the dynamic behavior of the microgrid. In this

Energy losses can still occur within the system due to various factors such as converter inefficiencies, transmission losses, and system control limitations. Hybrid MGs, on the

To identify the effectiveness of control strategies through system simulation, a review of various modeling designs of individual components in a solar PV microgrid system is

Different control problems in a MG system such as frequency and voltage stability, load balancing, bidirectional power flow with EV integration,

This presents a significant challenge for controller hardware-in-the-loop (CHIL) testing on the real-time digital simulator, especially for high-frequency switching converters.
